Document No.: DTFRP/PQ&S	Revision No.: 00	Issue Date -

Product Quality & Safety CAPA Process

Identifying Product Quality & Safety Issues:

Sources of Information:

Customer Complaints:
Track and analyze customer feedback regarding product defects, safety concerns, or performance issues.

Internal Quality Control:
Monitor results from incoming material inspections, in-process inspections, and final product inspections.

Production Data:
Analyze production data to identify trends or patterns indicating potential quality or safety problems.
Supplier Performance:

Evaluate supplier quality performance and address any recurring issues with raw materials.
Industry Alerts & Regulatory Updates:

Stay informed about industry-wide safety concerns, product recalls, and changes in regulations that might impact Automotive Component production.

Initiating a Product Quality & Safety CAPA:

Risk Assessment:
Evaluate the severity and potential impact of the identified issue on consumer safety and product quality.

CAPA Trigger Criteria:
Establish clear criteria for initiating a CAPA based on the risk assessment, such as:

- Severity of potential harm to consumers.
- Frequency or likelihood of occurrence.
- Potential for regulatory non-compliance.
- Impact on brand reputation and customer satisfaction.

Investigation & Root Cause Analysis:

Cross-Functional Team:
Assemble a team with expertise in quality, production, product design, and safety to investigate the issue thoroughly.

Data Collection & Analysis:
Gather and analyze relevant data, including:

Customer complaint details.

- Production records and quality control data.
- Material specifications and test results.
- Product design specifications.
- Applicable regulations and safety standards.

Root Cause Analysis Tools: (Utilize tools like:)
- 5 Whys
- Fish bone Diagram
- Fault Tree Analysis
- Failure Modes and Effects Analysis (FMEA)

Implementing Corrective & Preventive Actions:

Corrective Actions:

Address the immediate issue to prevent further occurrences. This might involve:
- Product recalls or rework.
- Production process adjustments.
- Machine repairs or replacements.
- Retraining of personnel.

Supplier corrective actions.

Preventive Actions:
- Implement measures to prevent similar issues from arising in the future. This might include:
- Design modifications to improve product safety or performance.
- Strengthening quality control procedures.
- Implementing additional safety testing protocols.
- Enhancing supplier quality management.
- Updating work instructions and training materials.

Effectiveness Verification & CAPA Closure:

Monitoring & Data Analysis:

Monitor the effectiveness of implemented actions through ongoing data collection and analysis. This might involve tracking:

- Customer complaint rates.
- Internal quality metrics.
- Production data trends.
- Supplier performance metrics.

Verification Activities:
Conduct additional testing, inspections, or audits to verify the effectiveness of corrective and preventive actions.

CAPA Closure:
Formally close the CAPA once effectiveness is confirmed and documented.

Additional Considerations for Product Safety:

Compliance with Safety Regulations:
Ensure foot Wear comply with all relevant safety regulations and standards (e.g., Consumer Product Safety Commission (CPSC) guidelines)

Product Testing & Certification:
Conduct thorough safety testing and consider obtaining relevant safety certifications to demonstrate product compliance and build consumer trust.
