RCA AND CAPA ON Measurement & Analysis

Identification Of Problem: During the review of measurement and analysis processes, all testing, calibration, and monitoring activities were found to be accurate and reliable. No discrepancies or deviations in measurement data were reported, ensuring consistent product quality.	
Why-Why Analysis	
Why1: Why are measurement and analysis processes accurate?	Because all instruments are calibrated regularly and testing procedures are standardized.
Why2: Why are instruments calibrated regularly?	Because preventive maintenance schedules and calibration SOPs are strictly followed.
Why3: Why are SOPs followed consistently?	Because staff are trained and understand the importance of precise measurement.
Why4: Why is staff training effective?	Because continuous training and competency assessments are conducted.
Why5: Why is continuous training maintained?	Because management emphasizes quality, accuracy, and compliance in all measurement processes.
RCA (Root Cause): Accurate and reliable measurement and analysis are achieved through calibrated instruments, structured procedures, trained personnel, and strong management oversight.	
Implementation Of Action Plan:- Continue regular calibration of all measurement instruments. Maintain standardized testing and analysis procedures. Conduct periodic internal audits to verify accuracy and reliability. Ensure staff training programs are ongoing and competency assessments are performed.	

Corrective Action	No corrective action is required as all measurement and analysis activities are operating within defined specifications and showing consistent accuracy.		Date	
Preventive Action	Maintain routine calibration and maintenance schedules for all instruments. Continue staff training and periodic competency evaluations. Keep accurate records of all measurement and analysis activities for traceability. Conduct periodic reviews to ensure continued reliability and compliance.		Date
