S.O.P. ON NON- CRITICAL POINT

1. Objective

To establish a systematic approach to identify, monitor, and manage non-critical points in manufacturing to ensure process consistency, improve efficiency, and maintain desired quality standards.

2. Scope

This SOP applies to all production and quality processes where non-critical parameters are identified, including Customer / Market Requirement, Product Concept & Development, Raw Material , Incoming Raw Material Inspection & Testing (Identity, , Purity), Approved Raw Material Storage (Controlled & Conditions), , Processing / Manufacturing , In-Process Quality Checks ,Finished Goods Inspection & Testing , Approved Finished Goods Storage Packing , Dispatch / Distribution.

3. Definitions

Non-Critical Point: Any operational or process parameter that does not significantly impact product safety, regulatory compliance, or major functional performance but may affect minor quality attributes, aesthetics, or process efficiency.

4. Responsibilities

Production Supervisor: Monitor and record non-critical points during operations.

Quality Assurance Team: Audit and verify adherence to SOP.

Maintenance Department: Ensure equipment involved in non-critical areas is maintained as per schedule.

5. Procedure

5.1 Identification of Non-Critical Points

Identify process steps where non-critical parameters are involved.

Examples:

Minor design variation in products.

Machine cleanliness .

5.2 Documentation

Maintain a **Non-Critical Point Checklist** for each process area.

Record observations during routine inspections.

Note deviations and observations in the **Non-Critical Point Logbook**.

5.3 Monitoring Frequency

Daily visual inspection or weekly audit, depending on the process.

Include checks in internal audit schedule.

5.4 Acceptance Criteria

Define acceptable limits/tolerances for each non-critical point in the process sheet or quality control plan.

Acceptable ranges must be reviewed and approved by QA.

5.5 Action for Deviation

Inform process owner for necessary adjustments.

No production hold is required unless the deviation trends toward critical.

Document corrective actions.

5.6 Continual Improvement

Use trend analysis to monitor frequent non-critical point deviations.

Implement minor Kaizen improvements to reduce deviation recurrence.

6. Records

Non-Critical Point Checklist

Non-Critical Point Logbook

Internal Audit Reports

Corrective Action Reports
